# March 2018 Quarterly Operations Report

---

## 1. Key Points

### Kroussou Project

- TKM has now finalised the acquisition of 100% of the highly prospective and underexplored, Kroussou Zinc-Lead Project in Gabon.
- The work completed by TKM to date will culminate in a maiden exploration drilling campaign to commence during June 2018.
- Anomalies within the Dikaki Channel highlight the potential for extensions to known mineralisation.

### Lawn Hill Project

- A meeting with the Traditional owners of the region to negotiate the grant of the tenements has now been scheduled for July 2018
- Widespread Copper, Cobalt, Zinc and Lead anomalism has been indicated following compilation of historic stream sediment data.
- Anomalies directly along strike, in the same structural corridor that hosts the Walford Creek Copper-Cobalt-Zinc-Lead Project (Aeon Metals Limited, ASX: AML).

### Arunta Lithium - Cobalt Project

- Historical exploration review to evaluate numerous opportunities within the extensive ground package is ongoing with field checking to commence during Q3 2018.

## 2. Kroussou Project

### 2.1 100% Acquisition

Trek was delighted to confirm earlier today that it has now completed the acquisition of 100% of the Kroussou Zinc-Lead Project in Gabon from TKM's JV partner, Battery Minerals Limited (ASX:BAT) (BAT). (refer to ASX announcement 30 April 2018 for full details of the terms of the acquisition).

### 2.2 Surface Geophysics

Surface geophysics comprising predominantly NSAMT (Natural Source Audio Magneto-Tellurics) with some GAIP (Gradient Array IP) and DDIP (Dipole-Dipole IP) has now been completed.

Comprehensive coverage of the Dikaki, Bouambo and Bouambo South channels with partial coverage of the Niambokamba channel has now been undertaken.

Imagery (see Figure 2) has indicated numerous large conductive bodies being present within all channels, sometimes spatially associated with areas where historic drilling, soil sampling and geological mapping has indicated near-surface mineralisation.

This geophysical data will continue to be utilised in conjunction with all datasets to develop a comprehensive suite of drill targets for testing during the upcoming programme.

### 2.3 Drilling

Trek continues to compile all its recently collected datasets comprising surface geophysics, surface geochemistry, geological mapping along with historic and confirmation drilling to develop drill targets for the upcoming maiden exploration drilling programme at Kroussou.

The programme is anticipated to commence during June 2018 and will comprise approximately 2,000m of diamond drilling at numerous targets.

The targets to be tested are a combination of new areas and extensions to known mineralisation. It is the Company's intention to ensure that the drilling is structured such that the potential for TKM to estimate an exploration target post this drilling programme is maximised.

Trek looks forward to updating the market on some of these targets as we lead up to drilling.

### 2.4 Tenement

TKM has decided not to upgrade the prospecting licence to the west of the main Kroussou Licence and has allowed it to lapse. The depth of un-prospective cover in the region has been interpreted as too deep for the feasible extraction of any potential mineralisation.

## 3. Lawn Hill Project

### 3.1 Tenement Applications

The process of negotiating access arrangements to allow for the grant of the Lawn Hill Project tenure is ongoing. A meeting with Traditional Owners has been scheduled for July 2018.

## 4. Arunta Project

### 4.1 Future Work

Compilation of historical data continues with tenement consolidation and field checking to begin during Q3 2018.

## 5. Kangaluwi Copper Project

### 5.1 Court Case

The Company is awaiting written judgement by the Judge of the Lusaka High Court on the appeal lodged by organisations associated with the conservation movement in Zambia on 17 January 2014 against the decision of the Minister of Lands, Natural Resources and Environment Protection to approve the Company's 100% owned Kangaluwi Copper Project. The stay of execution remains in place pending the outcome of the appeal against the Minister's decision.

TKM is currently evaluating its options with respect to the divestment of this Project.

## 6. Tenements

Tenement	Holder	Last Qtr Interest	Current Qtr Interest
EPM26707 (appl.) (Queensland)	Trek Metals Limited	100%	100%
EPM26708 (appl.) (Queensland)	Trek Metals Limited	100%	100%
G4-569 (Gabon)	Select Explorations Gabon SA (Wholly owned subsidiary of Battery Minerals Limited)	0% (Option agreement to enter into JV to earn up to 70%)	0% (subsequent to Qtr end)
EL31564 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%
EL31565 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%
EL31566 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%

EL31567 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%
EL31598 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%
EL31599 (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%
EL31728 (appl.) (Northern Territory)	ELM Resources Pty Ltd (100% owned subsidiary)	100%	100%

13170-HQ-LPL (Zambia)	Cheowa Resources (Incorporated JV- 51% Glencore 49% TKM)	49%	49%
13171-HQ-LPL (Zambia)	Cheowa Resources (Incorporated JV- 51% Glencore 49% TKM)	49%	49%
8573-HQ-LPL (Zambia)	Cheowa Resources (Incorporated JV- 51% Glencore 49% TKM)	49%	49%

#### COMPETENT PERSONS STATEMENT

*The information in this report that relates to exploration results is based on information compiled by Mr Bradley Drabsch, Member of the Australian Institute of Geoscientists (“AIG”) and Managing Director of Trek Metals Limited. Mr Drabsch has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a competent person as defined in the JORC Code 2012. Mr Drabsch consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.*

Figure 1: Kroussou Project Location Plan

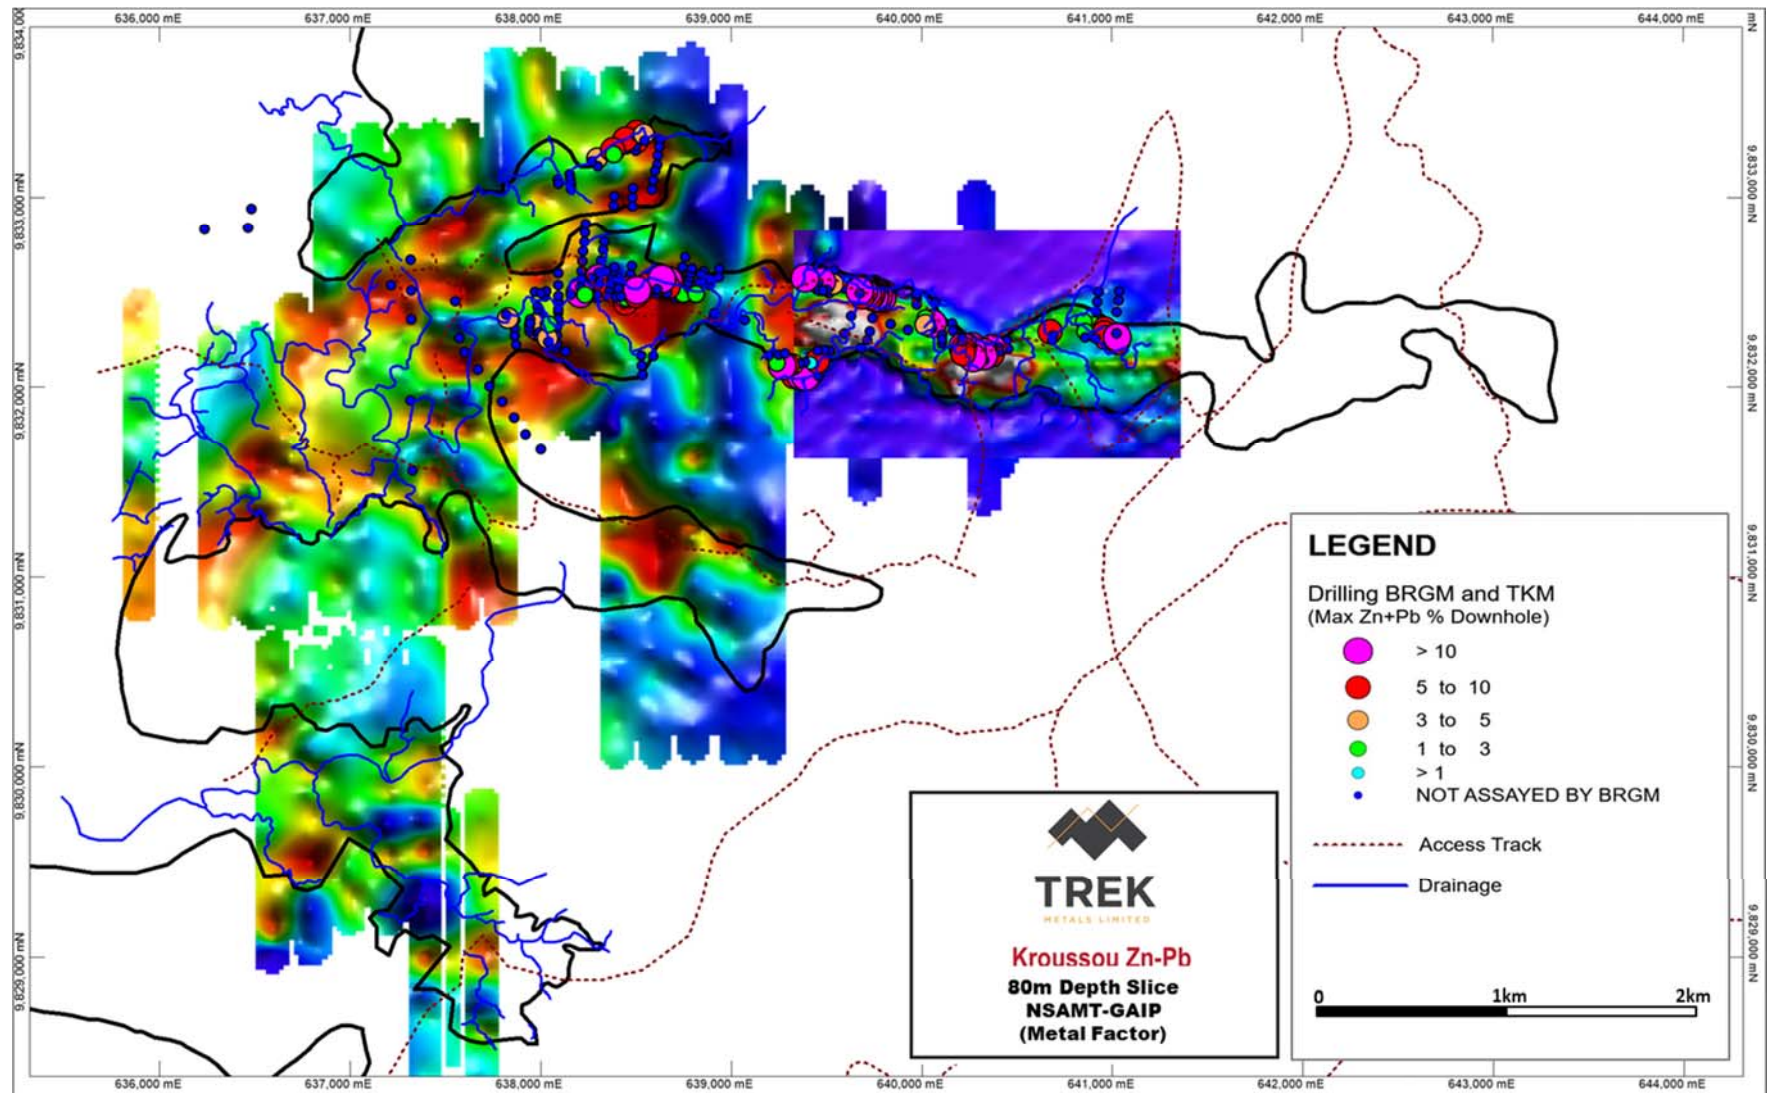

Figure 2: Geophysical image (metal factor – chargeability/resistivity) over part of the Dikaki Channel. The anomalies may represent down dip and along strike extensions to the known mineralization (for details of intersections, refer ASX Announcement 11 May 2017)

## JORC Code, 2012 Edition – Table 1

### Section 1 Sampling Techniques and Data

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>• <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li>• <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li>• <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li>• <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>• Drill core has been cut in half using a coresaw.</li> <li>• No assaying has been undertaken as yet and none has been discussed in this document.</li> </ul> <p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>• Due to the historic nature of the drilling results reported herein, it is not possible to comment on the quality of the sampling used to produce the results described. It is known from the historic reports that the drillcore was sawn.</li> <li>• Results were obtained from historic reports produced by the Bureau de Recherches Géologiques et Minières (BRGM, French Geological Survey) during the late 1970's and early 1980's.</li> </ul> <p><b>Rock Samples</b></p> <ul style="list-style-type: none"> <li>• Samples collected at surface using a geological hammer where necessary</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>• Drilling is either HQ diamond or NQ diamond.</li> </ul> <p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>• Drilling was completed using a Winkie style diamond drill rig producing drill core of approximately 25mm diameter.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></li> <li>• <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></li> <li>• <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>• Core recoveries are measured using industry standard methods for each metre of core drilled.</li> <li>• The use of HQ diamond core ensures the best recovery under the conditions experienced in the project area.</li> <li>• No relationship between recovery and grade has been established.</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>Due to the historic nature of the drilling results reported herein, it is not possible to comment on the recoveries achieved at the time.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></li> <li><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i></li> <li><i>The total length and percentage of the relevant intersections logged.</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>Field logging to industry standard has been conducted on the drill core in its full condition. The core will be re-logged once cut. All observations are handwritten before being digitised into the company database. This method will allow the logging to support Mineral Resource Estimations if/when required.</li> <li>Geological observations such as lithology, alteration, mineralisation etc are qualitative whereas recovery, RQD etc are quantitative.</li> <li>100% of the drill core has been fully logged.</li> </ul> <p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>All drill core was logged in detail, however, due to the age of the drilling and the inability to check-log the core due to its destruction, these logs can be used as a guide only and will not be suitable for use in a Mineral Resource estimation.</li> <li>Qualitative: Lithology, alteration, mineralisation etc.</li> <li>All holes for their entire length appear to have been logged.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></li> <li><i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i></li> <li><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></li> <li><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></li> <li><i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i></li> <li><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>The drill core has been cut in half using a standard petrol-powered core saw.</li> <li>Sampling half core is industry standard.</li> <li>Core has been cut to ensure that both sides approximate one another to ensure representivity of each length.</li> <li>The sample size collected is appropriate for this stage of exploration.</li> </ul> <p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>Due to the historic nature of the drilling results reported herein, it is not possible to comment on the method of sampling, sampling techniques and sample preparation methodology.</li> <li>It is known that the core was sawn prior to assay.</li> </ul>

Criteria	JORC Code explanation	Commentary
<p><b>Quality of assay data and laboratory tests</b></p>	<ul style="list-style-type: none"> <li>• <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></li> <li>• <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></li> <li>• <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></li> </ul>	<p><b>Trek Drilling</b></p> <ul style="list-style-type: none"> <li>• Samples were processed in Gabon by Setpoint laboratories. Samples were: <ul style="list-style-type: none"> <li>○ Dried</li> <li>○ Crushed to 80% passing 2mm</li> <li>○ Pulverised to 80% passing 80 microns</li> <li>○ Packaged and sent to Intertek Genalysis in Perth</li> </ul> </li> <li>• Samples were assayed by Intertek Genalysis in Perth using a 4 acid digest (considered a total digest) with an ICP-OES or ICP-MS (element dependant) finish. Analytes included:</li> <li>• Au, Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn</li> <li>• Laboratory and Trek submitted QAQC samples returned results within acceptable limits.</li> </ul> <p><b>Historic Drilling</b></p> <ul style="list-style-type: none"> <li>• Due to the historic nature of the drilling results reported herein, it is not possible to confirm the method of assay or analytical technique however historical reports indicate the drill samples were analysed using atomic absorption methods but the digestion method is not clear.</li> <li>• No description of QAQC protocols is provided in the historic reports.</li> </ul> <p><b>Geophysical Parameters</b></p> <ul style="list-style-type: none"> <li>• <b>Gradient Array IP:</b> <ul style="list-style-type: none"> <li>Receiver: Zonge GGT32II 10 Channel</li> <li>Transmitter: GDD 5kVA</li> <li>Transmitter Frequency: 0.125Hz</li> <li>Line Spacing : 100m oriented North-South</li> <li>Dipole Spacing : 50m</li> </ul> </li> <li>• <b>Dipole Dipole IP:</b> <ul style="list-style-type: none"> <li>Receiver: Zonge GGT32II 10 Channel</li> <li>Transmitter: GDD 5kVA</li> <li>Transmitter Frequency: 0.125Hz</li> <li>Dipole Spacing : 50m recording to N=8</li> </ul> </li> </ul> <p>• <b>Natural Source Audio Magnetotellurics (NSAMT):</b></p>
